Their goal is to spend much less time on the former and much more time on the latter over time. At a higher level, the SRE team serves as a bridge between development teams and operations teams, allowing the development team to bring new programs or new features to production ³ as quickly as possible, while ensuring an agreed acceptable level of IT operations performance and risk of error in line with the service level agreements (SLAs) the organization does ³ have in place with its customers. Based on their experience and a wealth of operations data, the SRE team helps development and operations teams to establish service level indicators (SLIs): Measurements of service level provided by systems: metrics such as availability (uptime) or latency Service Level Objectives (SLO): Agreed means for measuring service level indicators Error assumptions: The maximum amount of time a system can fail or fail without violating SLA contractual terms. More than a metric, the error budget is the tool used by a site reliability engineering team to automatically reconcile a company's pace of innovation ³ its reliability of service.
